

Self-organized peptide lipid complexes:

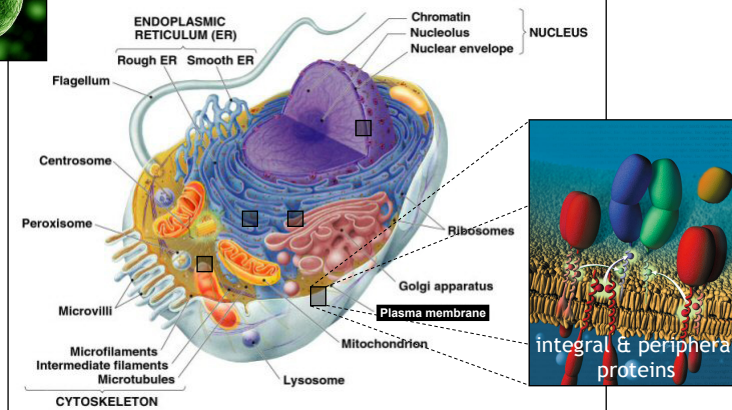

Peptide induced transmembrane
water pores.

Cell Membranes

- Membrane structures highly dynamic.
- Transformations primarily driven by lipid physics
- Modulated by proteins

Archetypal animal cell

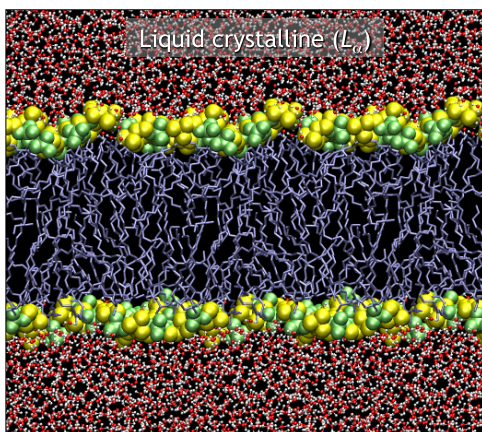

Cell Membranes

DMPC
2,3-dimyristoyl-*sn*-phosphatidylcholine
(C14:0)

Cell Membranes

Continuous lipid matrix

However partial breakdown required for:

- transport of ions,
- transport small molecules
- membrane fusion etc.

Pore formation in lipid bilayers.

water pore

Pores formed:

- spontaneously
(how primitive cells could take up ions)
- during aggregation
- after application of lateral tension
- electroporation

- Membrane curved at the openings
- Local perturbation of lipids.

- Hour-glass shape or toroidal pore.

Pores Metastable : Spontaneous Closure

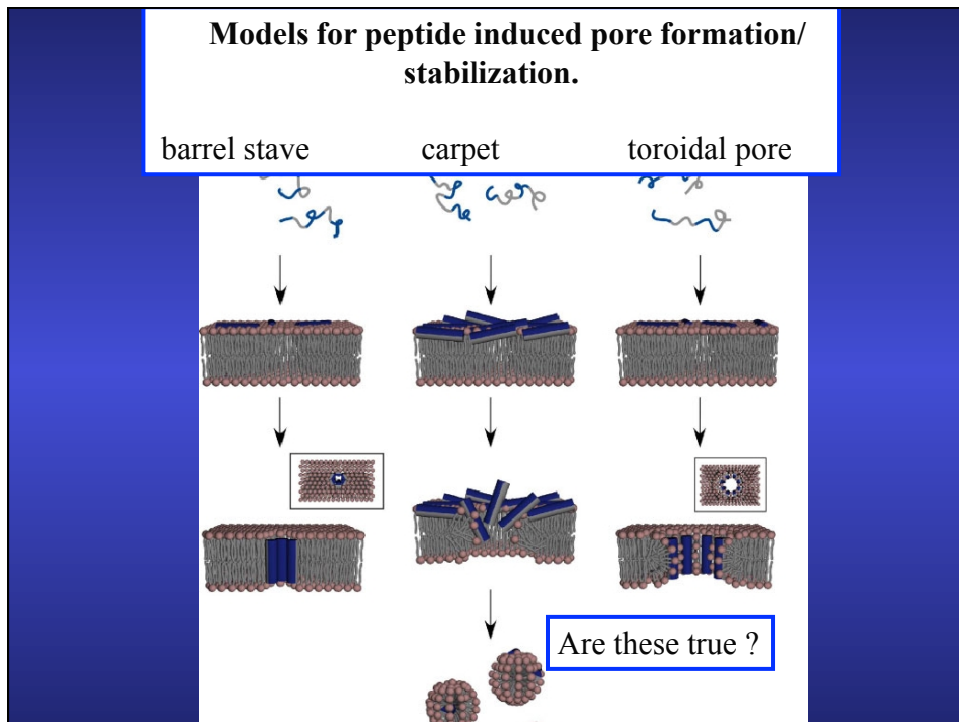

S.J. Marrink

Pore Forming Peptide Toxins: Models of Membrane Protein Assembly

- Released into the environment
- Soluble in water
- Recognize and bind specifically to membranes
- Assemble spontaneously into functional complexes

Pore formation by antimicrobial peptides: Case 1 Magainins

- Short cationic peptides from the skin of *Xenopus Leavis* (African clawed frog).
- Permeabilize the lipid matrix -> cell death.
- Bind preferentially to anionic lipids i.e. outer membrane of the bacterial cells.
- Broad antibacterial and anticancer activity (not hemolytic).
- Suggest formation of a toroidal pore (Neutron scattering).

What is known:

1. bind to membrane.
2. aggregate.
3. form pore (release ions).

Proposed General mechanism

Magainin H2 (MG-H2)

sequence:

^{+q} ^{+q} ^{+q}
 ILE ILE LYS LYS PHE LEU HIS SER ILE TPR LYS
 PHE GLY LYS ALA PHE VAL GLY GLU ILE MET
 ASN ILE ^{+q} ^{-q}

23 amino acids
total charge 3+

properties:

-amphipatic

-binds to zwitterionic lipids

-structure: 50% α -helical (CD spectra in the presence of PCs)

-forms pores by cooperative action

-pore diameter ~ 2nm

-proposed to form a toroidal pore

Proposed Mechanism of Toroidal Pore Formation

Brogden, Nat. Rev. Micr.
3,238-250(2005)

Magainin H2 (MG-H2)

1 copy placed randomly in solution
(no tension)

- Migrates to interface
- Embeds
- Partial helical structure
- no pore

Hari Leontiadou

Magainin H2 (MG-H2)

2 copies placed in solution P/L 1:32
(tension 20mN/m)

- Migrates to interface
- Embeds
- Significant helical structure
- PORE FORMATION

Leontiadou H, Mark AE, Marrink SJ 2006 Antimicrobial peptides in action JACS 128, 12156-12161

One peptide,
nothing happens ...

Two peptides,
still nothing happens.

Four peptides, however ...

Magainin H2 (MG-H2)

4 copies, initially in the solution P/L 1:16
no tension

- Aggregates
- Migrates to interface
- Embeds

Spontaneous
PORE FORMATION

Antimicrobial Peptides: Case 2 Melittin

Principle component of Bee venom

26 amino acids.

+6 charge at pH 7.0

Acts by forming toroidal pores

Gly-Ile-Gly-Ala-Val-leu-lys-Val-Leu-Thr-Thr-Gly-
Leu-Pro- Ala-Leu-Ile-Ser-Trp-Ile-Lys-Arg-Lys-Arg-
Gln-Gln-NH₂

6 melittin, GROMOS 43a2 FF
128 DPPC (*Berger Parameters*)
NP₁₁P_zT ensemble; Reaction Field; PBC
Temp. 323K ; SPC water

Durba Sengupta

Effect of Melittin on Lipid Bilayers

Sengupta et al. *Biochim. Biophys. Acta - Biomembranes*. 2008, **1778**, 2308-2317.

Effect of Melittin on Lipid Bilayers

- A. Below a critical concentration pores did not form.
- B. Pores did not form if the peptides did not cluster.
- C. Pore formation required at least 3 peptides.
- D. Screening the charge interactions slows pore formation.
- E. Removing positively charged amino acids blocks pore formation.

Durba Sengupta

Disordered Model For a Toroidal Pore

Peptides not fully Inserted
Partially Unfolded

Mechanism

- Asymmetric binding of peptides induces stress in second layer.
- Spontaneous formation of pore.
- Pore stabilized by binding primarily to the entrance of the pore.

Advantages:

- Simple
- Does not require insertion of peptides into lipid matrix.
- Pore metastable (*Collapse as peptides migrate through the pore?*).

Antimicrobial peptides from Australian frogs

Structure in membrane mimic environments

Mode of Action

- ▶ **Positive** curvature linked to formation of toroidal pores and micelles, compared to H_I
- ▶ **Negative** curvature explained by the aggregate model, non-bilayer intermediate resembles H_{II}
- ▶ **Cubic** phases can lead to porous membrane structure or fragmentation into micelle like structures

Peptides inducing positive curvature

- Peptides lining channel walls

- Peptide binding to surface

- Cause formation of highly curved micelles after breaking the bilayer

The interaction of Kalata B1 within membranes (binding and self-assembly)

Rong Chen
August 25, 2010

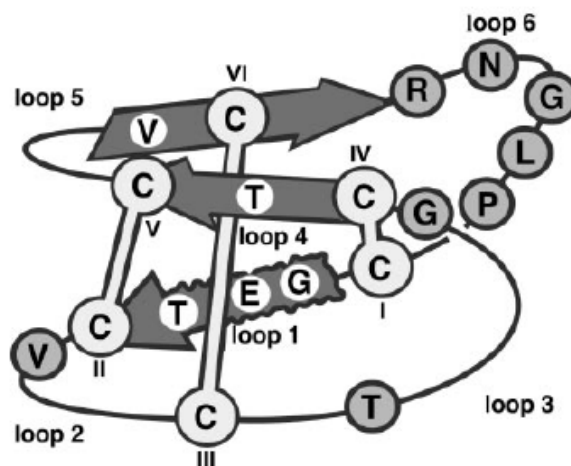

Introduction

- Kalata B₁ (KB₁)
 - A 29-residue cyclic peptide isolated from plants
 - Remarkably stable structure
 - Head-to-tail cyclic backbone
 - Three disulfide bonds between 6 Cysteines
 - Biological activities include
 - Antivirus, antimicrobial, antifouling, etc.
 - Mechanism of action
 - Membrane mediated

August 25, 2010

37

A proposed model for pore formation by KB₁

Huang et al. 2009. J. Biol. Chem. 284:20699

August 25, 2010

38

Aims

- To investigate
 - How KB1 binds to membranes
 - The association of KB1 into oligomers
 - How KB1 may form trans-membrane water-filled pores

August 25, 2010

39

Methods

- Molecular dynamics simulations
 - GROMOS 53a6 force field
 - GROMACS 3.3.3 simulation engine
 - 4 fs time step
 - Twin-range cutoff (0.8 nm, 1.4 nm)
 - Reaction field
 - Berendsen weak-coupling method (NpT)

August 25, 2010

40

Simulation one

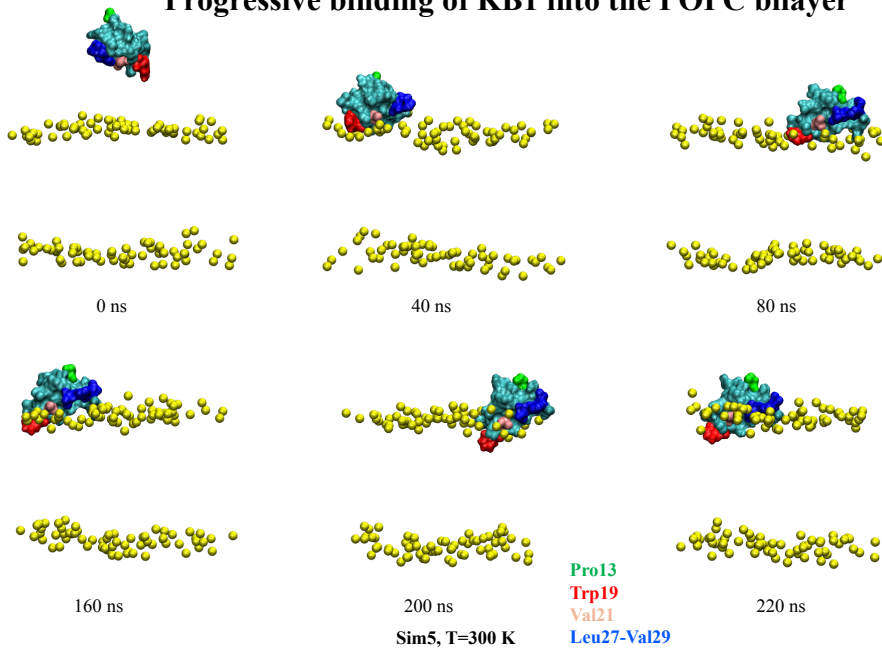

- Initial structures
 - 1 copy of KB1
 - POPC bilayer
 - 64 lipids/leaflet
 - Explicit water
 - Na⁺ and Cl⁻ (0.1 mol/L)
 - 300K → 350K

August 25, 2010

41

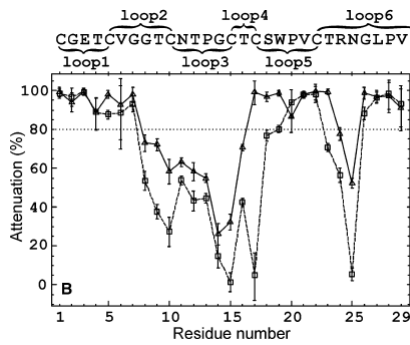

Progressive binding of KB1 into the POPC bilayer

August 25, 2010

42

Spatial structure of KB1 in DPC micelles derived from experiment

Attenuation in a 100-ms NOESY spectra of KB1-DPC micelle complex when 5-doxylstearate (Δ) or 16-doxylstearate (\square) was incorporated

Proposed model for KB1 in DPC (dodecylphosphocholine) micelles

August 25, 2010

49

Stabilization of pre-formed pores

- Initial structure
 - A pore was preformed by 8 dimers of KB1

Top view

Side view

August 25, 2010

50

The pore diameter shrank from 4.5 nm to 2.0 nm in 90 ns

0 ns, $D \approx 4.5$ nm

90 ns, $D \approx 2.0$ nm

$T=400$ K, NVT

August 25, 2010

51

Stabilization of pre-formed pores

- A equilibrated membrane pore

August 25, 2010

52

One KB₁ placed above the pore

August 25, 2010

53

Rapidly inserts deeply into the rim of the pore (< 10 ns)

Sim1, 10 ns

Sim2, 10 ns

T=350 K

Fixed area in the bilayer plane

August 25, 2010

54

More peptides added

T=350 K

Fixed area in the bilayer plane

August 25, 2010

55

Conclusions

- Can reproduce the structure of KB1 bound to a membrane suggested by experiment
- KB1 can form tetramers or higher
- KB1 shows a strong preference for binding to regions of positive curvature

August 25, 2010
